Abstract

Borneo Medispa is a beauty and skincare business that relies on effective inventory management to support its daily operations. Currently, inventory information is managed through WhatsApp and Google Sheets, with stock records updated manually. This process may make inventory information more difficult to retrieve, verify, and trace. To address these challenges, the Borneo Medispa Intelligence App (BoMI) is proposed as a Flutter-based mobile application for inventory management, initially focusing on Borneo Medispa's Miri branch. The application will centralise inventory records and provide stock-in and stock-out tracking, current stock monitoring, low-stock alerts, inventory reporting, and stock movement history. BoMI will also use Google Gemini through Supabase Edge Functions for two AI features. BoMI Scan will extract relevant item and quantity details from supplier invoice images into draft stock-in transactions for staff to review and approve before inventory records are updated. BoMI Insight will analyse available inventory statistics and usage trends to provide insights and replenishment recommendations. Overall, BoMI aims to improve access to inventory information, reduce manual data-entry effort, enhance stock movement traceability, and support informed replenishment decisions.

1. Introduction

This proposal outlines the scope, requirements, team organisation and development plan for developing BoMI. BoMI (Borneo Medispa Intelligence App) is a proposed mobile-based inventory management application for Borneo Medispa to track and manage inventory. Borneo Medispa depends on products, consumables, and resources to deliver its services and currently the staff coordinates stock levels through WhatsApp while keeping inventory records in Google Sheets. This often results in inconsistencies, making it harder to track past updates and keep everything organised. As operations grow, tracking what is in stock, what is available, and what staff needs to know becomes harder when the information lives in chat threads and separate spreadsheets. BoMI is therefore proposed to centralise inventory information in a dedicated platform accessible to authorised staff and managers.

BoMI will provide features such as stock-in and stock-out tracking, low stock warnings, inventory reporting, and an audit trail. It will also include two AI features, BoMI Scan and BoMI Insight, which reduce manual stock entry and support replenishment decisions. These features aim to support the monitoring of stock, make inventory records more accessible, and increase accountability with a better record of inventory movements. A mobile application is proposed because it allows authorised staff and managers to access and update inventory information easily on their mobile devices while performing their daily operations. This approach supports business digitalisation and more systematic information management. By centralising inventory records in one dedicated platform and reducing reliance on chat messages for stock updates, BoMI aims to improve the organisation, accessibility, and traceability of inventory information at Borneo Medispa. Research on technology adoption by Malaysian SMEs in the beauty, health and wellness industry also highlights the importance of usability and user acceptance in digital solution implementation (Qing et al., 2025). Therefore, the proposed application will emphasise practicality and ease of use to support the digitalisation of Borneo Medispa inventory management process.

1.1 Client Background

Borneo Medispa is a beauty and skincare business established in 2017 that provides facial treatments for various skin concerns, including acne, pigmentation, acne scars, and skin ageing. To deliver these services, the business relies on skincare products, consumables, and other resources. Therefore, accurate inventory records are essential to its daily operations. The client contact for this project is Cordelia Emily Anak Sekelie, a Beauty Therapist. Although Borneo Medispa operates multiple branches, the development and evaluation of BoMI for this project will focus on inventory management at the Miri branch. BoMI is intended to serve approximately seven users, comprising Branch Managers and Spa Staff who access, monitor, and update inventory information. Figure 1 shows the company logo and Figure 2 shows the Miri branch.

Figure 1: Company Logo

Figure 2 : Site photo

1.2 Team Background

Team 23:59 is the name of our project team, consisting of Vince Adhar Anak Sekelie as the team leader, Barachelle Eleazar Anak Gani, Dyril Chua Khang Jun, Mohammad Faris Hussain and Evanuell Ak Nicolas Kendy. The group name represents the final minute before a deadline and as a reminder that we push through until the very last moment. This meaning is reflected in our motto, "*It Will Never End Until It Is End*" which demonstrates determination to overcome challenges and see every task through to completion. Our team possesses technical skills in project planning, Flutter development, Git and GitHub, database design, software testing, and documentation for the BoMI development process. Through strong teamwork, efficient time management, and effective communication, we aim to coordinate our tasks efficiently to develop BoMI into a user-friendly inventory management application and bring BoMI to success. Figure 3 shows our team logo and Figure 4 shows the team members.

Figure 3: Team Logo

Figure 4: Team Members

2. Problem Statement

ID	Current process / problem	Impact on client	Evidence (source)
P1	Inventory information and stock movement updates are distributed between WhatsApp and Google Sheets	Previous inventory updates are difficult to retrieve, verify and trace	WhatsApp screenshots (Appendix C); inventory spreadsheet (Appendix D)
P2	Stock records require manual updates	Updating is time-consuming and prone to data-entry errors	Stock records and daily OUT columns (Appendix D, Figure D2)
P3	Recorded stock levels do not match actual stock after counting and updating	Stock figures cannot be fully trusted	Client questionnaire: 3 of 5 responses report stock not matching records (Appendix E, Figure E1)

Table 1: Summary of client problems

Proposed solution:

To address the problems in Table 1, we propose a Flutter Mobile app that centralises Borneo Medispa's inventory records, tracks stock movements and low-stock alerts, and maintains an audit trail, using AI to turn supplier invoices into draft stock entries (BoMI Scan) and recommend replenishment (BoMI Insight), with staff approval before any AI-prepared entry updates inventory.

3. Project Objectives & Success Metrics

No.	Objective	Solves	Success metric (how we measure)	Priority
O1	To study and analyse the client's current inventory process and document the requirements	P1, P2, P3	SRS signed off by the client at Milestone 1 (M1)	High
O2	To design and develop a Flutter app that centralises inventory management with stock tracking, low-stock alerts, inventory reports and an audit trail	P1, P2, P3	All Must-have FRs pass acceptance tests before release	High
O3	To integrate AI features (BoMI Scan and BoMI Insight) that reduce manual stock entry and support replenishment decisions	P1, P2	≥80% of invoice fields extracted correctly on a test set of 10 invoices; trend explanations and replenishment recommendations are consistent with the app's stock and usage figures in all test cases	High
O4	To test and evaluate the app with the client (Miri branch staff and managers)	P1, P2, P3	≥50 test cases executed, ≥60% code coverage, all critical defects resolved, client UAT sign-off	Medium

Table 2: Project objectives and success metrics

4. Project Perspective

4.1 Target Users

User type	Description	Main needs / goals	Device / tech level
Branch Manager	Oversees operations at the Miri branch and monitors inventory availability and stock movements.	View inventory summaries and generate reports, monitor stock availability, view stock movement history, receive low-stock alerts, review stock-in and stock-out records, and use AI-generated insights to support replenishment decisions.	Android phone, basic to intermediate
Spa Staff	Performs daily treatments and handles physical inventory in the stockroom at the Miri branch.	Record stock-in and stock-out transactions, check current stock availability, receive low-stock alerts, and scan supplier invoices using BoMI Scan to prepare draft stock entries for review.	Android phone, basic to intermediate

Table 3: Target users

4.2 System Context and Architecture

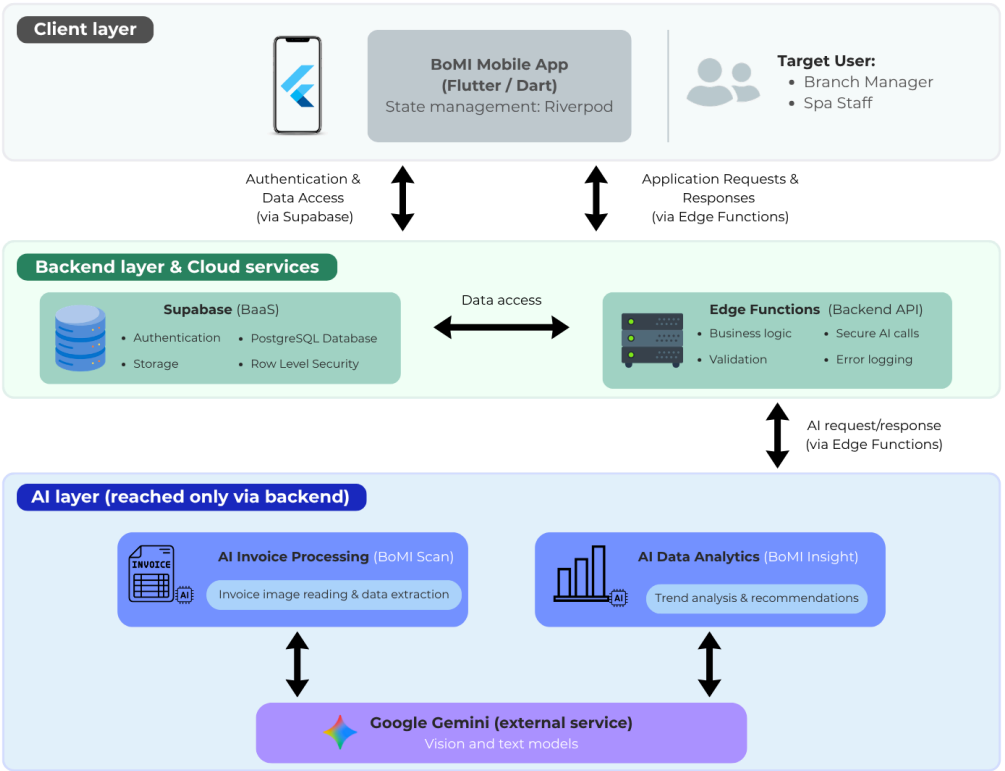

Figure 5: High-level system architecture

BoMI is a new system, since Borneo Medispa currently has no inventory application and relies on WhatsApp and Google Sheets to manage stock. Figure 5 shows the high-level architecture of BoMI, which has three layers: the client, the cloud backend, and the AI layer. Branch Managers and Spa Staff at the Miri branch (Table 3) use a Flutter mobile app, with Riverpod for state management (Riverpod, n.d.). The app connects to Supabase (Supabase, n.d.) for authentication and data management, including the PostgreSQL database, Storage, and Row Level Security (RLS) (Supabase Docs, n.d.-b). For business operations and AI features, the app sends requests to Supabase Edge Functions, which apply business logic, validation, and error logging, and read and write stock records in Supabase. The Edge Functions also call Google Gemini, an external AI service (Google AI for Developers, n.d.). BoMI Scan extracts details from supplier invoices, while BoMI Insight analyses stock usage trends and provides replenishment recommendations. The Gemini API key is stored as a server-side secret in Edge Functions (Supabase Docs, n.d.-a) and is never exposed in the mobile app. Staff must review and approve AI-generated stock entries before inventory records are updated.

5. Project Scope

5.1 In Scope / Out of Scope

Figure 6 shows the system boundary of BoMI, including the features inside the scope, the external AI service, and the items excluded from this project. Table 4 then lists the same scope boundary in detail.

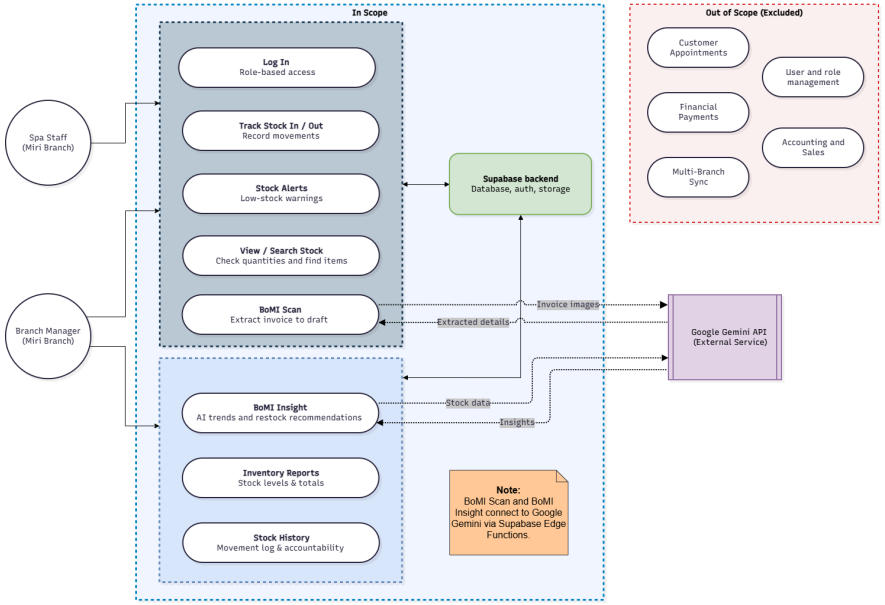

Figure 6: System Boundaries Diagram

In scope (will deliver this semester)	Out of scope (will not deliver)
Mobile inventory management application for branch managers and spa staff at the **Miri branch** only.	Inventory management or synchronisation across multiple branches.
Stock-in and stock-out tracking, current stock viewing, and item searching by name or code.	Customer booking or appointment management.
Sign-in with role-based access for Branch Managers and Spa Staff.	Integration with financial systems or payment gateways.
Low-stock alerts and inventory reporting.	User registration, account creation and user management, as accounts will be pre-created.
BoMI Scan: AI extraction of supplier invoice details into draft stock entries (staff review required).	Full accounting, sales or financial management features.
BoMI Insight: AI analysis of usage trends and replenishment recommendations	-
Inventory movement history and an audit trail for tracking stock changes.	-
Product list and minimum stock levels pre-loaded for the Miri branch.	-

Table 4: Scope boundary

5.2 Features and User Stories

Role-based Access

- **Spa Staff**: Can record stock-in and stock-out transactions, view and search inventory, receive low-stock alerts, and use BoMI Scan.
- **Branch Manager**: Has all Spa Staff permissions, plus access to stock movement history, inventory reports, and BoMI Insight.

FR-ID	Module	User story (As a … I want … so that …)	Priority
FR-01	User Access	As an authorised user, I want to sign in to BoMI so that only authenticated users can access the inventory system.	Must
FR-02	Inventory Management	As a Spa Staff member, I want to record stock-in transactions so that received inventory is added to stock records.	Must
FR-03	Inventory Management	As a Spa Staff member, I want to record stock-out transactions so that used or removed inventory is reflected in stock records.	Must
FR-04	Stock Monitoring	As a Spa Staff member, I want to view current stock quantities so that I can check item availability.	Must
FR-05	Stock Monitoring	As a Spa Staff member, I want to receive low-stock alerts so that I can identify items requiring replenishment.	Must
FR-06	Stock Monitoring	As a Spa Staff member, I want to search for inventory items by name or code so that I can quickly check item availability.	Must

FR-ID	Module	User story (As a … I want … so that …)	Priority
FR-07	Inventory History & Reporting	As a Branch Manager, I want to view stock movement history, including quantities, responsible users, and timestamps, so that I can track inventory changes.	Must
FR-08	Inventory History & Reporting	As a Branch Manager, I want to generate inventory reports showing stock levels and stock-in and stock-out totals for a selected period so that I can review inventory status.	Must
FR-AI-01	AI Assistance	As a Spa Staff member, I want AI to extract item and quantity details from a supplier invoice into a draft stock-in transaction so that I can review and approve the details before they are recorded.	Must
FR-AI-02	AI Assistance	As a Branch Manager, I want AI to explain inventory usage trends and provide replenishment recommendations so that I can make informed restocking decisions.	Should

Table 5: Features and user stories

Figure 7 groups the functional requirements in Table 5 into five modules, linking user access, inventory management, stock monitoring, inventory history & reporting and AI assistance functions. Features shown in orange are available to Branch Managers only.

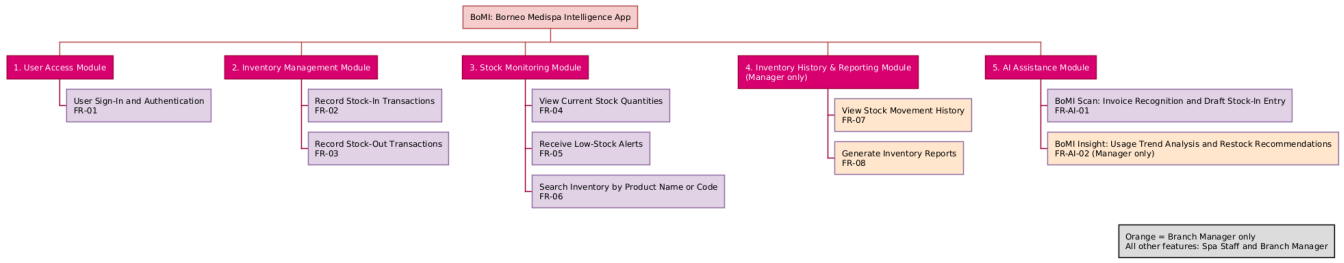

Figure 7: System modules diagram

5.3 AI Feature

BoMI integrates two AI-assisted features, BoMI Scan and BoMI Insight, to reduce manual administrative work and support inventory-related decision-making. BoMI Scan extracts relevant details from supplier invoice images to prepare draft stock-in entries, which reduces the manual stock updates described in P2. Supplier invoices vary in layout, so fixed rules would not read them reliably, which is why AI is used. BoMI Insight interprets the inventory statistics and usage trends calculated by the app and gives plain-language insights and replenishment recommendations, so the Branch Manager can see patterns that are hard to spot in WhatsApp messages and spreadsheets (P1). Both features assist users rather than replace staff verification and decision-making. Table 6 summarises the details of both features.

Item	Description
AI capability	**BoMI Scan:** Uses image recognition and text extraction to identify relevant details from supplier invoices. **BoMI Insight:** Uses AI to explain inventory trends and provide replenishment recommendations.
User value	**BoMI Scan:** Reduces manual entry of invoice details, addressing P2. **BoMI Insight:** Helps identify stock usage patterns and determine which items may require replenishment, addressing P1.
Input → Output	**BoMI Scan:** Supplier invoice image → Extracted item and quantity details in a draft stock-in entry for staff review. **BoMI Insight:** Calculated inventory statistics and available stock history → Plain-language insights and replenishment recommendations displayed alongside inventory information.
AI service / API	Google Gemini vision and text models, accessed through the Gemini API via Supabase Edge Functions. The Flutter application sends requests to the Supabase backend rather than calling Gemini directly.
Constraints	**API key protection:** Gemini requests go through server-side Edge Functions; the key is not exposed in the mobile app. **Cost:** Maintained within available API free-tier quotas. **Latency:** Network delay during API requests is managed with background processing so the app stays responsive. **Offline fallback:** Manual stock entry remains fully operational if the AI service fails. **Data privacy:** Excludes customer personal data and processes supplier invoices only with client approval.

Table 6: AI feature summary

5.4 Non-Functional Requirements and Constraints

NFR-ID	Category	Requirement / constraint	Target
NFR-01	Performance	The main dashboard should load quickly.	Loads within 2 seconds on a mid-range smartphone under normal network conditions
NFR-02	Security	AI API keys must not be exposed in the mobile app or committed to the GitHub repository.	Zero AI API keys committed to source control or embedded in the mobile app
NFR-03	Usability	Staff should be able to start an invoice scan easily.	Invoice scanning can be initiated within 3 taps from the dashboard.
NFR-04	Availability	Core stock functions must remain usable when the AI service is unavailable.	100% of stock-in and stock-out test cases pass with the AI service disabled

Table 7: Non-functional requirements and constraints

5.5 System Environment

Layer	Technology / tool	Justification
Mobile app	Flutter (Dart 3), Material 3	Meets the course requirement and supports cross-platform development from one codebase.
State management	Riverpod	Separates UI components from application logic and manages asynchronous data.
Backend / database	Supabase (Auth, PostgreSQL, Storage, RLS)	Provides authentication, relational data storage, file storage and database access control, with Flutter SDK support.
AI service	Google Gemini API (vision and text models)	Supports invoice image extraction for BoMI Scan and text-based insights and recommendations for BoMI Insight.
Version control & CI	GitHub, GitHub Actions	Supports collaborative development, version control and automated workflows required by the course.
Target devices	Android 8.0+ phones	Provides a mobile platform for Miri branch staff to access and update inventory during daily operations.

Table 8: System environment

6. Task Allocation & Team Contribution

Member	TSPi role	Owned features (FR-IDs)	Other responsibilities / contribution
Vince Adhar Anak Sekelie	Team Leader *(Scrum Master & Client Contact)*	FR-04, FR-05, FR-06	Primary client contact, weekly meeting, WEEK reports, final submission package.
Barachelle Eleazar Anak Gani	Development Manager *(Tech Lead & AI Integration)*	FR-AI-01, FR-AI-02	Flutter architecture, backend/Supabase, Gemini AI integration, SDS documentation, and code reviews.
Dyril Chua Khang Jun	Planning Manager *(Product Owner & Schedule Lead)*	FR-02, FR-03	TASK / SCHEDULE, GitHub board, SRS backlog, and milestone tracking (M1–M4).
Mohammad Faris Hussain	Quality/Process Manager *(QA & Test Lead)*	FR-07, FR-08	LOGTEST, CI, coverage, defect tracking, and quality assurance.
Evanuell Ak Nicolas Kendy	Support Manager *(DevOps & Documentation Lead)*	FR-01	Repo setup, LOGAI, tools, UAT, documentation, and release APK support.

Table 9: Task allocation and contribution

7. Team Goals

No.	Team goal	Measure
G1	Maintain product quality and technical stability.	100% Must-have FRs pass; ≥60% test coverage; CI passes on main.
G2	Maintain rigorous TSP and project discipline.	Milestones delivered on time; WEEK and required TSP logs updated weekly.
G3	Ensure fair contribution and collaboration.	Each member completes ≥1 assigned task and ≥1 PR per sprint; contributions match GitHub/PEER records.
G4	Maintain active client engagement and alignment.	Client meeting/feedback at least every 2 weeks; scope and UAT formally signed off.

Table 10: Team goals

8. Expected Results

8.1 Working System

BoMI will be delivered as a working Android application for Branch Managers and Spa Staff at Borneo Medispa's Miri branch. Authorised users will sign in using pre-created accounts. Spa Staff can record stock-in and stock-out transactions, view and search current stock quantities, receive low-stock alerts, and use BoMI Scan to extract item and quantity details from supplier invoice images into draft stock-in transactions. Staff must review and approve the extracted details before inventory records are updated. Branch Managers will have all Spa Staff permissions, as well as access to stock movement history and inventory reports showing stock levels and stock-in and stock-out totals for a selected period. They can also use BoMI Insight to obtain inventory usage insights and replenishment recommendations alongside inventory information. BoMI Insight will not automatically modify stock records. The system will be accepted when all Must-have functional requirements pass acceptance testing, no critical defects remain, at least 50 test cases have been documented and executed, code coverage reaches at least 60%, and the client provides user acceptance testing (UAT) sign-off with documented feedback. The final deliverable will be a signed release Android application package (APK), version 1.0.0.

8.2 Documentation and Artefacts

Deliverable	Submitted with
Project Proposal (original)	Proposal Submission (Week 4)
Revised Proposal and Software Requirements Specification (SRS)	Initial Report (Week 9)
Runnable prototype (4–5 screens), tagged release	Demo 1 (Week 9)
Software Design Specification (SDS), test plan and results (LOGTEST), user manual, maintenance plan, client acceptance form	Final Report (Week 13)
Release APK, demo video (5–10 min), presentation slides	Final Demo 2 (Week 14)
GitHub repository and complete project file	e-Archive (Week 15)
TSPi forms (LOGT, LOGD, LOGAI, SCHEDULE, SUMP, SUMQ, SUMS, SUMTASK, WEEK, PEER) and meeting minutes	Ongoing; compiled in Final Report

Table 11: Deliverables

9. Project Planning

9.1 Methodology

Team 23:59 will use an Agile approach based on Scrum, with two-week sprints, sprint planning, weekly progress reviews, backlog refinement, and continuous improvement based on feedback. This approach suits BoMI because the Miri branch's inventory workflow and AI features require regular client feedback and testing. Each TSPi role contributes through assigned responsibilities, task estimation, schedule monitoring, quality assurance, and maintenance of project logs. Each functional requirement uses a consistent FR-ID linked to a GitHub Issue and its corresponding test cases. Development follows this workflow: GitHub Issue → feature branch → implementation and unit testing → Pull Request review → GitHub Actions checks → merge into the main branch. Trello and the GitHub Projects board are used to track task progress, while GitHub manages source code, issues, Pull Requests, and automated checks. Client decisions and scope changes are documented in meeting minutes. Development will prioritise all Must-have requirements: sign-in, stock-in and stock-out tracking, current stock viewing, low-stock alerts, stock movement history, inventory reporting, inventory search, and BoMI Scan. BoMI Insight will be developed as a Should-have feature after the Must-have requirements have been addressed. The development milestones (Table 13) and Gantt chart will follow the course submission schedule (Table 12) to monitor progress from Week 3 to Week 15.

9.2 Submission Schedule

Phase	Deliverable	Week	Due
Phase 1: Planning & Development	Proposal Submission	4	9 Oct 2026
	Proposal Presentation	5	19 – 23 Oct 2026
	Initial Report	9	16 Nov 2026
	Demo 1	9	16 – 20 Nov 2026
Phase 2: Finalisation & Closure	Final Report	13	24 Dec 2026
	Final Demo 2	14	28 – 31 Dec 2026
	e-Archive	15	Before 10 Jan 2027

Table 12: Submission schedule

9.3 Development Milestones (GitHub)

Milestone	Week	Key output	Status
M1 – Scope & Requirements	4 – 5	GitHub repo, issue board, CI file; proposal and initial SRS in /docs	
M2 – Design & Prototype	9	SDS draft, 4–5 screen prototype, green CI, v0.2.0 tag	
M3 – Product & Verification	13	≥50 tests, ≥60% coverage, AI feature working	
M4 – Final Release & Acceptance	15	Release APK v1.0.0, client sign-off, e-Archive	

Table 13: Development milestones

Figure 8 shows the Gantt chart from Week 3 to Week 15, covering the six sprints and the final release phase, the four milestones (M1 to M4), and the submission deadlines in Table 12.

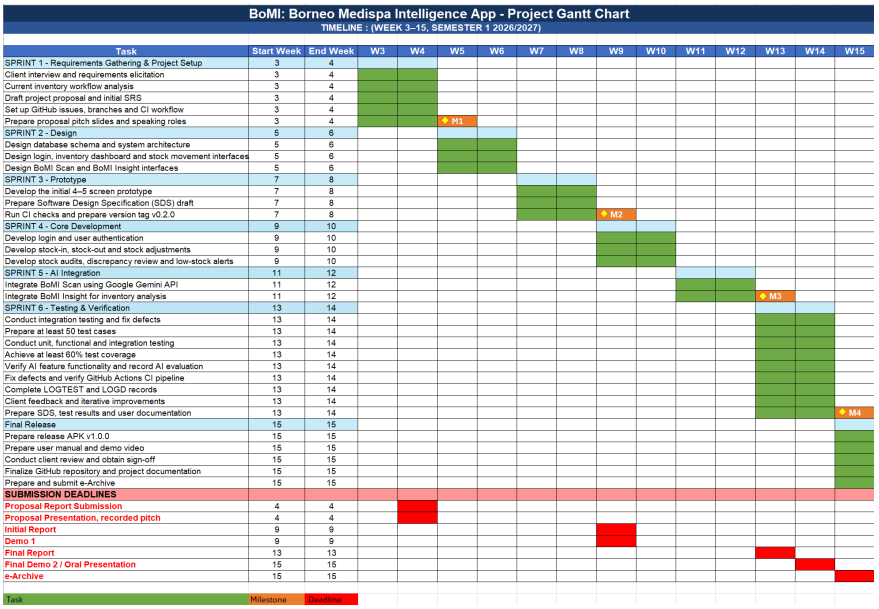

Figure 8: BoMI Development Gantt Chart (Weeks 3–15)

9.4 Risks and Assumptions

ID	Risk / assumption	Likelihood	Impact	Mitigation
R1	Client unavailable for meetings, feedback, or UAT.	Medium	High	Agree on fixed slots, send questions early, and use online fallback or written feedback.
R2	AI API free tier limits exceeded or service interrupted.	Medium	High	Monitor quotas, test with sample invoices, and keep manual stock entry as a fallback.
R3	Limited experience with Flutter, Supabase, or AI integration.	Medium	High	Build early proof-of-concepts, review PRs via GitHub, and consult official documentation.
R4	AI API key leaks or unauthorized data access.	Low	High	Store keys securely as server-side secrets in Supabase Edge Functions and enforce RLS.

Table 14: Risks and assumptions

Appendix A: Client Meeting Evidence

Date: 9 October 2026
Attendees: Vince and Faris

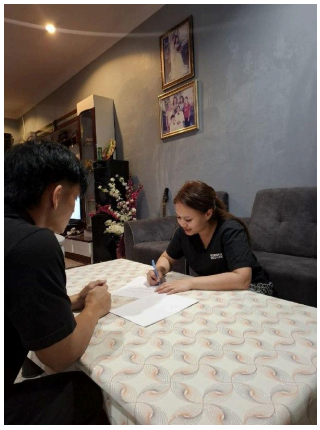

Discussion Summary:

The meeting discussed Borneo Medispa's inventory management problems, including stock information scattered across WhatsApp and Google Sheets, manual updates, and discrepancies between recorded and actual stock quantities.

Key Decisions:

- The client agreed on the proposed core features: stock-in/out tracking, low-stock alerts, inventory reports, audit trail, BoMI Scan, and BoMI Insight.
- The initial project scope will focus on the Miri branch only.
